

# **A**PPENDIX B.

## **PROJECT DEVELOPMENT AND PROJECT LISTS**

### **B. 1 MTP DEVELOPMENT**

The MTP is a strategic planning document designed to identify and address the transportation needs of the Houston-Galveston region through the year 2020. As such, the MTP forms the basis for transportation planning activities within the region and determines the region's future transportation system. The Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 makes the MTP a federal requirement for all urbanized areas and federally funded transportation projects must be included in the MTP. ISTEA requires the MTP to be updated at least every three years.

In 1995, work began on development of a long-range planning document called *Vision 2020* that addresses federal requirements and planning needs throughout the eight-county Transportation Management Area (TMA)<sup>1</sup>. *Vision 2020* is the Houston-Galveston region's MTP, replacing its predecessor, *Access 2010: 1994 Update*. The first step in the development process was identification of regional transportation needs. A series of public "visioning" meetings were held to discuss the needs of local transportation providers and users. At the same time, demographic forecasts for the year 2020 were developed which indicated the expected growth in population, households, and employment throughout the region. Data collection was also initiated to develop revenue forecasts for the region. A preliminary estimate of revenues and expenditures through the year 2020 was completed in December 1996. To aid in identifying future transportation needs, several sets of transit and highway scenarios were developed to assess the impact of each on future travel demand. This process resulted in a listing of project needs for the region. The "needs" list was further evaluated and prioritized based upon the expected benefits of each project.

The result of the project evaluation and prioritization process is a listing of short-range and long-range transportation strategies. The short-range listing identifies projects that address needs and are likely to be implemented within the first ten years of the MTP. The long-range element of the MTP includes transportation recommendations for the

---

<sup>1</sup> The TMA consists of Brazoria, Chambers, Fort Bend, Galveston, Harris, Liberty, Montgomery, and Waller counties.

period 2008 through 2020. The MTP also identifies needs that cannot be met due to financial and/or air quality constraints.

The following five-part project evaluation and prioritization process for *Vision 2020* was developed under guidance from the Technical Advisory Committee (TAC) to the Transportation Policy Council (TPC) over a period of many months.

**B.2**, “Vision 2020 Project Evaluation and Prioritization Process”, describes the overall evaluation process that includes all types of MTP projects and programs.

**B.3**, “Decision Rules for Evaluating Roadway Projects”, is the specific guidance employed to determine which roadway projects would be considered short-range candidates and which would be long-range candidates.

**B.4**, “Benefit/Cost Analysis of Candidate Roadway Projects” describes the methodology used to analyze short-range candidate roadway projects, both widenings and new construction projects.

**B.5**, “Target Funding Levels for Congestion Mitigation and Air Quality Improvement Program Projects”, refers to a proposal for establishing “target” funding levels for categories of projects that would be eligible for CMAQ funding.

**B.6**, “Project Readiness Criteria”, refers to the criteria developed specifically to assess the likelihood that a candidate project could be implemented within the timeframe of the Transportation Improvement Program if selected for funding.

## **B.2 PROJECT EVALUATION AND PRIORITIZATION**

### **A. Sort projects into categories**

1. Operations and Maintenance:
  - Transit
  - Roadway
2. Rehabilitation and Preservation:
  - Transit
  - Roadway
3. Air Quality/ Energy:
  - Projects whose primary objective is to directly reduce vehicle emissions (i.e., alternative fuels program, air quality public outreach programs, etc.)
4. Bicycle/Pedestrian
5. Intermodal:
  - Projects whose primary function is to improve ingress and egress to seaport, airport, trucking, and rail facilities or otherwise directly impact the distribution of goods throughout the region

6. Roadway Expansion
  - Widenings
  - New location
7. Transit:
  - New Transit Services or transit service expansion
  - Fixed Guideway and HOV lanes
8. Transportation Demand Management (TDM)
  - Projects such as congestion pricing, employer trip reduction programs, regional rideshare program, vanpooling, etc.
9. Transportation System Management (TSM) / Traffic Operations:
  - Intersection improvements
  - Synchronized signalization
  - Grade separations

B. Assume funding levels for operations, maintenance and rehabilitation in accordance with forecasted needs

C. Assess short-range and long-range needs for roadway expansion

With the exception of new roadway construction, projects in the roadway expansion category will be evaluated for congestion and other benefits. The maximum score that any project may receive is 200 points (100 for congestion and 100 for other benefits). Projects scoring 50 points or more will be considered candidate short-range strategies. The short-range candidate projects will then undergo a benefit/cost analysis to determine their relative priorities.

New roadway construction projects will skip the first step in this process and go directly to the benefit/cost analysis to determine the feasibility of each project.

1. Congestion

Max. 100 pts.

Year/ Congestion Level	Moderate Area	Moderate Facility	Serious/ Severe Area	Serious/ Severe Facility
2000	10	10	25	25
2010	5	5	15	15
2020	0	0	10	10
TOTAL	15	15	50	50

2. Other Benefits

Max 100 pts.

- **25 pts.** Project relieves an existing bottleneck or fills a gap in the existing roadway system resulting in improved traffic flow
- **25 pts.** Project is located on a hurricane evacuation route
- **25 pts.** Project contributes to the MTP goal of a multimodal system with seamless connections by improving passenger and commuter choices

- **25 pts.** Project is located on a National Highway System connector or serves as a primary route for transporting goods directly to and from an intermodal terminal

**D. Evaluate CMAQ/Transit projects and short-range roadway expansion**

Air quality/energy, bicycle, intermodal, TDM, TSM, and transit projects are generally eligible for funding under the Congestion Mitigation and Air Quality Improvement (CMAQ) program. It is assumed that these projects could be implemented within the first ten years of the Plan given adequate levels of funding.

The evaluation for short-range roadway expansion projects and CMAQ/transit projects is based upon the following performance measures:

Group	Analysis	Performance Measure
Roadway expansion: new location and widenings	Benefit/Cost	Travel Time Savings
CMAQ/Transit	Benefit/Cost	Emission reductions, VMT reduction, travel delay savings

**E. Financially constrain the Plan for the Short-range period and then for the Long-range**

This process may require a reassessment of priorities. Some short-range projects may be moved to the long-range project listing due to funding constraints.

**F. Evaluate projects in the Short-range period for inclusion in the TIP based upon:**

1. Eligibility for funding categories
2. Project readiness
  - Right-of-way acquisition
  - Local match
  - Design/preliminary engineering/environmental

**G. Ensure that the MTP is financially constrained and meets all air quality conformity requirements**

## **B.3 DECISION RULES FOR EVALUATING ROADWAY PROJECTS**

**1. Congestion**

Two different levels of congestion are evaluated for projects, the level of congestion on the roadway and in the area in which the project will be located. For both the roadway level analysis and the area level analysis, congestion is based upon 24 hour per lane volume to

capacity ratios (V/C) for existing and committed roadways. The levels of mobility (LOM) used to define congestion are as follows:

LOM	V/C
Tolerable	< 0.85
Moderate	>0.85, < 1.00
Serious	>1.00, < 1.25
Severe	> 1.25

The evaluation capacity is based on the number of vehicles per lane per day and varies for urban/suburban and rural roadways as follows:

Facility	Urban	Suburban	Rural
Freeways	23,500	23,500	16,500
Tollways	18,000	18,000	-----
Expressways	11,000	11,000	-----
Arterials	7,500	6,250	5,000

For analysis purposes the serious and severe levels of mobility are combined to form a serious or severe LOM where the volume to capacity ratio is greater than 1.00. Projects are analyzed for the time period in which serious/severe or moderate levels of congestion first appear. The three time periods are 2000, 2010, and 2020. The same analysis is undertaken to determine the time period and level of congestion for the area in which the project is located. The width of the congested area is defined as one and one half a mile on either side of a moderately or seriously/severely congested roadway in urban areas and three miles on either side in rural areas. The length of the area depended on the length of the congested portion of the arterial. Since project limits do not always correspond to congested area or roadway lengths, if 50% or more of the project is located in a congested area or on a congested roadway, it is considered congested. New construction projects are not evaluated for roadway-level congestion.

## 2. Other Benefits

- **25 pts.** Project relieves an existing bottleneck or fills a gap in the existing roadway system resulting in improved traffic flow

Projects that would construct missing segments of existing roadways are identified as gap fillers. They are generally located on arterials approximately 3 miles or less in length in developed areas and 6 miles or less in less developed areas. These projects, if completed, would serve as alternative routes to parallel roadways and improve access in developing areas.

Bottlenecks are widening projects on existing roadways where reductions or fluctuations in the number of lanes contribute to congestion. The entire project may be identified as a bottleneck even though in some cases the project extends beyond the point of the bottleneck. For example, project number 20 on SH 6 would widen the roadway from 2 to 6 lanes from Senior Road to FM 521. Although SH 6 changes from 6 lanes to 2 lanes

at Senior Road the entire project is identified as a bottleneck because it would relieve the congestion that is attributable to the lane at Senior Road.

- **25 pts.** Project is located on an evacuation route

The Hurricane Contingency Planning Guide produced by the Texas Department of Public Safety (DPS), updated April 1994, identifies hurricane evacuation routes in Brazoria, Chambers, Galveston and Harris Counties. Some evacuation routes extend into southern Fort Bend County as well. Candidate MTP projects are compared to the hurricane evacuation routes identified in the DPS plan to determine their status as evacuation routes. New construction projects that appear to be alternative routes to designated evacuation routes are identified as evacuation routes. For example, new SH 35 proposed for Brazoria County was identified as a primary evacuation route because it would serve as an alternative route to the existing SH 35 that is designated as an evacuation route in the DPS guide.

- **25 pts.** Project contributes to the MTP goal of a multimodal system with seamless connections

In general, those projects that involve improvements to facilities that serve at least two different modes of travel are defined as enhancing the multimodal system or improving connections between modes. This criterion emphasizes the movement of people. For example, High Occupancy Vehicle (HOV) lane projects are considered multimodal projects because they provide an alternative to single-occupancy vehicle travel for travelers. Projects that directly improve connections between two or more modes of travel are also considered to be multimodal projects. Park & Ride facilities are seen as multimodal improvements because they improve transfers between automobile and transit modes.

- **25 pts.** Project is located on a National Highway System connector or serves as a primary route for transporting goods directly to and from an intermodal terminal

Following the passage of the National Highway System Designation Act of 1995, 66 intermodal terminals were identified for the Houston-Galveston region. In a joint effort, H-GAC and the Texas Department of Transportation identified a number of intermodal connectors, roads that connect intermodal terminals directly to the National Highway System (NHS). Projects proposed for intermodal connectors are given points for this criterion. New roadway construction projects that directly serve intermodal terminals may also be considered intermodal connectors. This would include the construction of mainlanes on existing right-of-way as long as the mainlanes would directly connect to an intermodal facility. The emphasis for this criterion is on the improvement of goods movement within the region.

## B. 4 BENEFIT/COST ANALYSIS OF CANDIDATE ROADWAY PROJECTS

This part of the project evaluation process outlines the methodology by which short-range roadway projects are evaluated and ranked based on cost effectiveness. The procedure relies on estimated improvements in travel time of users of the proposed project and on the estimated cost of the project. Travel time, or vehicle hours of travel, is calculated on a link by link basis and totaled over the length of the project. Travel time savings are calculated as the difference between the travel times on the facility with and without the improvement, using modeled traffic volumes for years 2000 and 2020 on the existing plus committed (E+C) roadway network. Assuming a stream of benefits starting in 2000 and ending 2020, the net present value (NPV) of the benefits is obtained. The cost effectiveness, or the benefit/cost index, is then calculated as the product of the ratio of the annual average of the NPV to the annualized cost of the project and an indexing factor.

### Roadway Widening Project Methodology:

$$\text{B/C Index} = \left[ \frac{\text{Avg. Annual Net Present Value of Travel Time Benefit}}{\text{Annualized Cost}} \right] \times 100$$

### Supporting Calculations

#### **Average Annual Net Present Value of Travel Time Benefit**

*Travel Time Benefit for years 2000 and 2020:*

Travel Time Benefit = (Travel Time Savings) x (AVO) x (# Days per Year) x (Dollar Value of Time)

*Where,*

Travel Time Benefit = Travel time savings to all users of the facility, in \$/year.

Travel Time Savings = Travel Time Before Improvement – Travel Time After Improvement (in Vehicle Hours of Travel)

Travel Time Before Improvement = [Project Length ÷ Speed (w/o)] x Traffic Volume]

Travel Time After Improvement = [Project Length ÷ Speed (w/)] x Traffic Volume]

AVO = Average Vehicle Occupancy (a constant)

Dollar Value of Time = Average dollar value of an equivalent work hour, per person.

(The average dollar value of truck travel is factored in based on the estimated percentage of truck traffic along that facility type.)

*For all other years:*

$$\text{Travel Time Benefit}_I = (\text{Travel Time Benefit}_{00}) \times [1 + \text{Growth Factor}]^{(I - 2000)}$$

*Where,*

Travel Time Benefit<sub>I</sub> = Savings in travel time to facility users in year I

I = year of analysis

Travel Time Benefit<sub>00</sub> = Savings in travel time to facility users in year 2000

$$\text{Growth Factor} = (\text{Travel Time Benefit}_{20} / \text{Travel Time Benefit}_{00})^{(1/20)} - 1$$

Travel Time Benefit<sub>20</sub> = Savings in travel time to facility users in year 2020

*Average Annual Net Present Value:*

$$\overline{NPV} = \left[ \sum_{i=0}^n \frac{\text{Travel Time Benefits}_i}{(1 + \text{rate})^i} \right] / n$$

*Where,*

NPV = Average annual net present value of travel time benefits for *n* years

*i* = the year of calculation

*n* = the total number of years, 21 (FY 2000 through FY 2020, inclusive)

Travel Time Benefits<sub>*i*</sub> = the benefits for the year of calculation

rate = 7% (annual discount rate)

### **Annualized Cost**

In most cases, project costs (exclusive of right-of-way) are estimated by project sponsors in the analysis. In some cases, however, no cost has been submitted or the cost is significantly lower than independent cost estimates developed by H-GAC's project cost consultant using typical Texas Department of Transportation (TxDOT) unit cost information.

$$\text{Annualized Cost} = (\text{Project Cost, Excluding ROW}) \times (\text{Capital Recovery Factor})$$

$$\text{Capital Recovery Factor} = \text{rate} (1 + \text{rate})^n / (1 + \text{rate})^n - 1$$

### **New Location Roadway Project Methodology:**

New location roadway projects are evaluated using a methodology that is virtually the same as for widening projects. However, since there are no traffic volumes or speeds on facilities prior to their existence, staff uses a proxy approach to obtaining the necessary data. As with the widening methodology, staff assumes that the volumes in the year of analysis would be the same both the “before” and “after” scenarios. Hypothetical speeds for facilities “before” improvements are obtained from a matrix of typical speeds for certain congestion levels and area types (see table given under the Assumptions below).

$$\text{B/C INDEX} = [(\text{AVG. ANNUAL NET Present Value of Travel Time Benefit}) \div (\text{Annualized Cost})] \times 100$$

### **Assumptions:**

Constant	Value	Source
Value of Time (Cost of Congestion/Person Hour)	\$ 11.71 per hour	TTI, 1997
Value of Truck Time	\$ 45.00 per hour	TTI, 1997
Percentage Truck Travel	13.29% Urban Fwy 11.96% Urban Non-Fwy 13.69% Rural Fwy 9.65% Rural Non-Fwy	Coastal Oxidant Assessment for Southeast Texas (COAST), 1993
Average Vehicle Occupancy	1.25	TTI, 1997
Number of Days/Year	313	Project Evaluation Procedures, 1995 TIP
<i>Is</i> (economic lifespan)	40 years for bridges and overpasses 30 years for urban freeways 20 years for all other roadways	TxDOT - District 12, 1997 Recommendations are based on the Houston District design standards.
<i>rate</i> (discount rate)	7.0%	Federal Guidelines, 1996

Speed Matrix for New Location Projects:

<b>Congestion Level</b>	<b>Area Type</b>			
	Urban	Urban Fringe	Suburban	Rural
Tolerable	25	27	32	50
Moderate	20	22	28	45
Serious & Severe	18	20	25	40

*Numbers indicate speed in miles per hour (MPH)*

*Source: Houston-Galveston Regional Travel Demand Models, 1997.*

## B.5 TARGET FUNDING LEVELS

The Congestion Mitigation and Air Quality Improvement Program (CMAQ) is an innovative funding category established by the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) to help States implement projects that contribute to attainment of national air quality standards. CMAQ funding is focused on investment in air quality improvements and provides funds for projects that expand or initiate transportation services with air quality benefits. The ISTEA created flexible guidelines that allow the CMAQ program to cut across traditional boundaries and encompass projects and programs dealing with highways, transit, and non-traditional areas, such as vehicle emission inspection and maintenance, pedestrian and bicycle programs, and demand management strategies to name a few<sup>2</sup>.

The primary purpose of the CMAQ program is to fund projects and programs that reduce vehicle emissions and congestion. With these objectives in mind, previous analysis of candidate CMAQ projects for the 1995-1997 TIP was performed in two principal stages. Each eligible project's annualized cost (net of local contributions) was compared to its expected air quality benefits (total annual pounds reduction of Volatile Organic Compounds (VOC) plus Nitrogen Oxides (NO<sub>x</sub>)). This ratio determined each project's relative "cost effectiveness". In the second stage, projects were reviewed for "readiness" or the project's ability to be implemented within the 3 year TIP time frame.

The TAC members began meeting in December 1996 to discuss the evaluation and prioritization of candidate transportation and air quality projects that may be eligible for funding under the Congestion Mitigation and Air Quality Improvement Program. After reviewing the 1995 TIP evaluation process, the TAC indicated that the methodology should be revised to give weight both to the potential air quality and mobility benefits of proposed CMAQ projects. The task force also discussed the desirability of allocating some portion of CMAQ funding to "groupings" of candidate projects to ensure regional goals identified in the MTP were not lost in the process of project evaluation, comparison and selection.

<sup>2</sup> A Guide to the Congestion Mitigation and Air Quality Improvement Program, U.S. Department of Transportation, 1993.

Six primary categories of projects were identified as eligible for CMAQ funding:

1. Bicycle/Pedestrian
2. Air Quality/Environmental
3. Travel Demand Management (TDM): Rideshare/Vanpool
4. Transit
  - New Service/P&R
  - Fixed Guideway/High Occupancy Vehicle (HOV) lanes
5. Intermodal
6. Transportation System Management (TSM) /Traffic Operations
  - Intersection improvements
  - Grade separations, ramp improvements
  - Signal coordination

Subsequent to the work completed by the TAC, the Transportation Policy Council endorsed a methodology for allocating future funding among the six different categories of candidate CMAQ projects. The funding allocation establishes “target” funding levels for each category of projects. The actual allocation may vary as projects are selected for implementation in the Transportation Improvement Program depending upon project development, regional priorities, and available funding each year. A project-level analysis will also be necessary prior to implementation in the TIP to determine the emission benefits of each project.

<b>CMAQ Project Category</b>	<b>10-Year Target Funding Levels (millions)</b>	
Bicycle & Pedestrian	\$33	7%
Air Quality/Environmental	\$35	7%
TDM: Rideshare/Vanpool	\$47	9%
Transit:		
New Service/P&R	\$56	11%
Fixed Guideway/HOV	\$76	15%
Intermodal	\$29	6%
TSM:		
Intersection Improvements	\$22	4%
G/Seps, Ramps	\$51	10%
Signal Coordination	\$153	30%
	\$502	100 %

## B.6 PROJECT READINESS FOR THE TIP

The TIP is the implementation device for the MTP. It details an implementation schedule for the first three years worth of projects in the MTP. One of the important criteria for selection as a TIP project is “readiness”. “Readiness” refers to the ability of a project to be ready for contract letting in the year in which it is programmed in the TIP. This is an important criterion for the TIP because projects that are not let in their programmed year must be re-programmed into a later fiscal year. TxDOT districts may not exceed their obligation authority for a given fiscal year. Therefore, re-programming a project into a later fiscal year impacts the ability to let other projects proceed to contract in that year.

As the ISTEA of 1991 has matured, procedures have evolved as requirements of the Act have been interpreted. The TIP selection process is an example of an evolving procedure. Since the inception of ISTEA, TIP selection procedures have changed as the state and metropolitan planning organizations have developed a better understanding of the regulations and processes inherent in ISTEA. It has been the experience in this region that many projects selected for previous TIPs have not be ready to let to construction within the TIP timeframe. As a result, the readiness criteria are being more carefully reviewed for the 1998-2000 TIP.

Previous information mailed to project sponsors regarding TIP readiness criteria stated that “...four key factors are examined to determine project readiness: the basis for cost estimates, the completeness of environmental analyses, availability of right-of-way (ROW), and local government financial commitment.” It further states that projects “...not significantly developed in each of these areas are considered to be beyond the timeframe of the TIP.” Additional detail regarding each of these issues is provided below.

### *Cost Estimates*

Cost estimates are important in determining readiness because they indicate the development status of projects. For example, if preliminary engineering is included in the cost estimate because it has not completed, the project is not likely to be ready for implementation in the TIP timeframe. In general, projects that do not have well-developed cost estimates are not far enough along in the development process to be considered ready for implementation.

### *Environmental Analyses*

All federal-aid projects must complete the National Environmental Protection Act (NEPA) process. A finding of no significant impacts (FONSI), a record of decision (ROD) or a categorical exclusion (CE) is necessary before federal funds can be expended on a project. One of the first steps in the NEPA process is completion of an environmental assessment (EA). The EA basically “flags” potential environmental problems should any exist. It indicates if any additional permits or analyses are required for a proposed project. If the EA results in a FONSI, then the project may move forward. If the EA indicates the potential for significant environmental impacts, then generally an environmental impact statement (EIS) will be required.

Projects proposed for construction on new locations requiring land acquisition are especially vulnerable to the possibility of needing an EIS. In addition to new roadways, construction of park and ride lots, high occupancy vehicle lanes, and transit stations on new locations are likely to need an EIS. It may take several years to complete the required environmental analyses for these types of projects. Other types of projects, such as roadway widenings or grades separations within existing right-of-way are less likely to have significant environmental impacts. Consequently, completion of the environmental process prior to selection as TIP project is not expected to result in delays in implementation.

### *Right-of-Way*

Because right-of-way acquisition is potentially litigious and time consuming, a significant amount of right-of-way should have already been acquired for projects that will require additional right-of-way. Significant is defined to mean that at least fifty percent of the necessary right-of-way has been acquired. If a project sponsor has agreements with landowners that would expedite the acquisition process, that information should be documented and submitted for consideration in the readiness determination.

### *Local Commitment*

Project sponsors must submit documentation to provide the local matching funds required for federal-aid projects. Generally, a minimum of twenty percent of the remaining eligible costs associated with a project is required. Project sponsors may choose to commit to a greater percentage of the project cost. Previous project expenditures by project sponsors are not reimbursable. However, commitment of local funds in the form of previous expenditures effectively lowers the cost of the project and increases its cost-effectiveness.

### *Other Factors Affecting Readiness*

In addition to the factors listed above, certain administrative requirements must be met before a project can be let to contract for construction. Project sponsors must develop a contract with the Texas Department of Transportation, a process that may take a year to complete. The length of the contract development period effectively reduces the amount of time available to project sponsors to address the readiness criteria.

The Clean Air Act Amendments (CAAA) of 1990 states that no additional single occupancy vehicle (SOV) capacity may be built in a TMA within a nonattainment area unless the project complies with a congestion management system (CMS). Since a CMS has not yet been implemented in the Houston-Galveston TMA, a SOV analysis must be completed for projects that will result in significant increase in capacity for SOVs (i.e., adding general purpose lanes to an existing highway or constructing a new highway). The analysis must include an assessment of all reasonable travel demand reduction and operational management strategies for the corridor in which an added capacity project is proposed. The SOV analysis should be part of the environmental assessment for a proposed project. If it is not, then a separate SOV justification must be completed prior to programming the project. The requirement for a SOV justification has significant implications for project readiness.

## B. 7 PROJECT LISTING

### Funding Summary:

Category	TIP (1998-2000)	Short-Range (2001-2007)	Long-Range (2008-2020)
CMAQ	\$196,012,573	\$452,305,639	\$809,695,452
Transit	* \$1,878,839,024	\$939,083,727	\$1,478,558,493
Roadway	\$854,735,860	\$3,532,839,950	\$5,127,290,557
Other	\$283,649,095	\$309,857,167	None

*\* Includes Metro's Regional Bus Plan and carryover grants*

The projects lists are divided into short-range and long-range sections. CMAQ Program projects are shown first, followed by Transit, Roadway and Safety, Rehabilitation and Other project lists. Projects selected for inclusion in the 1998-2000 are listed first for each section. All projects are shown in alphabetical order. Individual project priorities are reflected only in the project's inclusion in a short-range or long-range list.

## CMAQ PRIORITIES

### 1998-2000 Transportation Improvement Program Projects

Category	Prj. ID.	Project Number	Co.	Street	From	To	Description	Cost	Lead Agency
Air Quality	3027	960492A-XX	VA	VA	8-COUNTY NON-ATTAINMENT		CLEAN AIR ACTION PUBLIC OUTREACH PROG - FY 98 (\$440K)	\$550,000	H-GAC

## ROADWAY PRIORITIES

### 2001-2007 Short-range Projects

Short-range roadway projects are sorted in descending order by total benefit/cost index within each funding category. It should be noted that projects have been placed in their most “likely” funding categories. However, upon implementation, projects may be funded from a combination of federal, state and local sources. Selected projects in the Urban Mobility category denoted as “HP-2000” have highest priority for selection in the 2000-2002 TIP.
